

RTD32- Surface Mount Weld Pad Style Resistance Temperature Detector with Lead Wire and Connector

TEMPERATURE SENSOR

RTD32 A Weld Pad RTD32 is a type of surface resistance temperature detector designed specifically for measuring temperatures on metal surfaces. It ensures precise thermal contact and accurate temperature readings by featuring a flat, flexible sensing tip that can be directly welded or brazed onto a metallic surface. This type of thermocouple is widely used in applications requiring permanent or semi-permanent temperature monitoring of pipes, vessels, and equipment in harsh industrial environments.

RTD Wire Configuration

2 Wire: In 2 wire RTDs, one lead wire is connected to each wire of the RTD element. 2 Wire RTDs are an economical option for the applications where high accuracy is not required. Since there is no compensation wire, the accuracy of RTD can be affected if long lead wire is used.

3 Wire : 3 wire RTDs are the most common type of RTDs used in the industry. In 3 three-wire Rtd 1 wire is connected to the one side of the RTD element, and on the other side, 2 wires are connected to compensate for the resistance. With compensating wire, accuracy is very close to the element accuracy at the termination end.

4 wire: 4 wire RTDs are highly accurate. In 4 wire RTDs 2 wires are connected to each side of the RTD element. With additional wire on each side of the RTD element, the output at the termination is highly accurate. 4 wire RTDs are recommended where high accuracy and long lead wire is required.
